Executive Commentary:

- **Churn Reasons:** Features (29.6%), Support (27.0%), and Budget (26.7%) are the top reasons cited among churned customers — closely followed by Pricing and general dissatisfaction (both 24.4%). No single reason dominates; churn is driven by a fairly even spread across product, service, and cost concerns.
- **Downgrade Signal:** Downgrade activity is a weak early-warning signal — only 13.9% of churned customers had a preceding downgrade, meaning the vast majority of churn happens without that warning sign. Downgrade tracking alone isn't sufficient to predict churn risk.
- **Plan Tier Risk:** Churn rates are similar across all plan tiers (Enterprise 30.5%, Pro 29.7%, Basic 27.5%), but Enterprise accounts for the majority of MRR lost (78.6%) due to its higher subscription values — meaning tier isn't a churn-risk differentiator, but it is a revenue-impact differentiator.
- **Geographic Risk:** UK and Australia have the highest churn rates (69.0% and 68.7% respectively), though on relatively small account bases (58 and 32 accounts). The US, despite a lower churn rate (63.2%), accounts for the largest MRR loss (\$645.7K) given its much larger customer base (291
